

ECONOMIC ASSESSMENT OF THE
CHAMBLY CANAL
1984-85

EVALUATION AND ANALYSIS DIVISION
SOCIO-ECONOMIC BRANCH
MAY 1986

SUMMARY

ECONOMIC BENEFITS TO QUEBEC :

Important as it is for recreational purposes, the Chambly Canal also generates significant economic impacts. These impacts result from expenditures made to operate and maintain the canal, as well as purchases made by boaters and land based canal visitors.

By examining the economic impacts of Chambly Canal operating, maintenance and visitor expenditures, we can provide a minimal estimate of the economic repercussions for one year.

Parks expended \$1.95 million in 1984-85 to operate and maintain the canal. The 107 thousand land based visits plus the 6 thousand boats that passed through the locks, resulted in a conservatively estimated \$245 thousand in expenditures for items such as food, transportation, and accommodation. Thus in 1984-85, \$2.20 million was expended by Parks and canal visitors.

The economic impacts of these expenditures are summarized in the following table. All results include the direct, indirect, and induced impacts.

Estimated 1984-85 Economic Impact in Quebec of the Chambly Canal

Total Person-Years of employment generated	94 P.-Y.
Total Labour Income Generated	\$1.92 million
Total Gross Domestic Product Generated	\$2.62 million
Revenue Generated for Quebec Government	\$0.39 million
Revenue Generated for all levels of Gov't in Quebec	\$0.93 million

NOTE: Results obtained using the Statistics Canada's
Interprovincial Input-Output Model.

Employment

Of the 94 person-years generated, 37% (or 34.5) are in the tertiary sector of the economy. This sector is mainly service oriented and thus highly labour intensive. It includes "both" retail and accommodation businesses. Over 16 of the person-years generated were in these two sectors alone indicating the important tourism role the canal plays. The \$1.95 million expended by Parks results in a ratio of 1 person-year of employment generated for about every \$20,800 expended.

Labour Income

Labour income, which is defined by Statistics Canada as salaries, wages and other supplementary labour income, was estimated at \$1.92 million. Thus, for every dollar expended to operate and maintain the canal, \$0.98 was generated in the Quebec economy in the form of labour income.

Government Revenue

Expenditures by Parks and visitors result in the generation of revenue for the various levels of government. Revenue is mainly generated as a result of direct and indirect taxes imposed by the governments on goods and services purchased. For the provincial government alone, Parks and visitors expenditures generated nearly \$385 thousand in revenue. The federal and municipal governments also received in total about \$550 thousand in revenue. Therefore, considering all levels of government in Quebec, \$935 thousand in revenue was generated. In other words, every dollar expended by Parks in 1984-85 on Chambly, 48¢ was returned in the form of government revenue of which 20¢ was returned to the Quebec government alone.

The above estimates must be considered conservative as they do not include estimates of the proportion of equipment purchases by canal visitors that could legitimately be attributable to canal operation. Nor do these figures include the value of the land and businesses that are dependent on canal operation. Estimates of these items require special study. However, a report of the Task Force on Program Review suggested that the overall economic impacts are high. Industries such as boat building and construction are affected by the maintenance of canals. This report also suggests that significant benefits accrue to anyone owning land or facilities along canals. While figures on these benefits have not been developed, they would appear to be even larger than those generated by the \$2.20 million in Parks and visitor expenditures.

INTRODUCTION

The purpose of this report is to evaluate the impact on the Quebec economy of Chambly Canal expenditures and visitor spending attributable to the canal facilities. The following results demonstrate that the Canal's economic impact complements Parks mandate "To protect for all time those places which are significant examples of Canada's natural and cultural heritage and also to encourage public understanding, appreciation and enjoyment of this heritage in ways which leave it unimpaired for future generations." (Parks Canada Policy 1983, p. 11).

The impact on the Quebec economy of spending attributable to the Chambly Canal for the 1984-85 fiscal year is estimated by using Statistics Canada's 1979 version of the interprovincial input-output model.¹ This impact is analyzed in terms of employment, labour income, gross domestic product and government revenue. Chapter I examines spending attributable to the canal. It identifies the expenditures injected into the Canadian economy by both Parks (DOE) and visitors using the canal. Chapter II discusses the impact on income in terms of labour income, gross domestic product and total income. Chapter III examines the economic repercussions of the Chambly Canal on employment. Finally, chapter IV discusses how the canal affects government revenue.

1 The basic hypothesis and the method employed are not explained in this report. Those interested may refer to Evaluation of the Impact on the Canadian Economy of Spending Attributable to National Heritage Locations Administered by Parks Canada, Volumes I, II, III and IV, Parks Canada, Socio-Economic Division, April 1983.

CHAPTER I

SPENDING ATTRIBUTABLE TO CHAMBLY CANAL

For the purposes of this study, the impact of the Chambly Canal on the Quebec economy results from 1) government expenditures to operate, maintain, and repair the canal and 2) spending by visitors that is directly attributable to the canal. Government expenditures are obtained from Parks financial records. The estimate of visitor spending, on the other hand, is the end result of applying two successive models. The first model, developed by the Socio-Economic Branch (SEB), uses attendance data; the second is Tourism Canada's Tourism Impact Model (TIM).

The economic impact on the Quebec economy of these expenditures is measured with the aid of the Statistics Canada interprovincial input-output model of the Canadian economy. This model makes it possible to see how demand is generated in the Canadian economy and how it affects income, employment and government revenues in each province.

1.1 Parks Related Expenditures

Financial records to June 30, 1985 show that during the 1984-85 fiscal year, Parks spent some \$1.95 million on the Chambly Canal. From this total, \$14 thousand in revenue was earned from rental of lands adjacent to the canal and public utility services, etc. These revenues are subtracted from the total of Chambly expenditures to arrive at the expenditures that actually have an economic impact. This subtraction results in a total of \$1.94 million. Figure 1(a) illustrates this transaction.

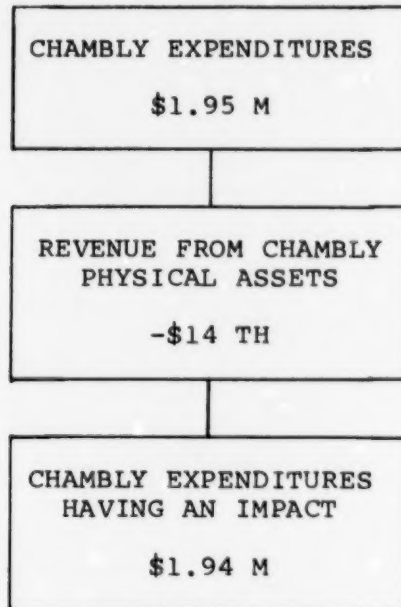

1.2 Visitor Spending

In 1984-85, an estimated 107.2 thousand land based visits were made to Chambly locations while 6 thousand boats passed through the locks. Expenditures made in getting to and during the visit at these locations fall primarily into five economic sectors: 1) transportation, 2) accommodation, 3) food and beverages, 4) entertainment and recreation, and 5) other trip costs.

The transportation sector includes all vehicle maintenance services, purchases of goods (including gasoline) and all other modes of transportation used by tourists. In 1984-85, Chambly Canal visitors spent \$28 thousand in this sector. Visitors also spent an estimated \$141 thousand on accommodation and an estimated \$28 thousand on food and beverages.

FIGURE 1(a)

Parks' (DOE)
Chambly Expenditures
Having An Economic Impact

The entertainment and recreation sector includes theatre and movies, various types of trips and entertainment and other recreational services. Visitors to Chambly locations spent just over \$24 thousand in this sector during 1984-85. The "other trip costs" sector consists of: retail sales, taxis, personal services, car rentals and travel agents. Visitor spending in this sector totalled \$24 thousand in 1984-85.²

2 For further information about the method used to estimate visitor spending: Evaluation of the Impact on the Canadian Economy of Spending Attributable to National Heritage Locations Administered by Parks Canada, Volume II, April 1983.

Combining the five expenditure sectors, it was estimated that visitors spent a total of \$245 thousand in 1984-85 while visiting the Chambly Canal. Part of this visitor spending (lock permits and licences, marine services, etc.) represents revenue to Parks. The amount involved, which totals \$9 thousand, must be deducted from the \$245 thousand figure if we are to derive the amount of spending that has an impact on the Ontario economy. Visitor spending having an economic impact therefore totals approximately \$236 thousand, as illustrated in Figure 1(b). It is assumed here that without the existence of the Chambly Canal, the visitors would not have spent these \$245 thousand.

1.3 Final Canadian Demand

The analysis thus far shows that the Chambly Canal has injected a net \$1.94 million into the economy and that canal visitors spent \$236 thousand. The total estimated final demand in the Canadian economy is therefore \$2.17 million. Final demand is defined as the demand which is in fact actually generated in the economy.

Of this \$2.17 million in final demand, the model estimates that \$120 thousand are accounted for as goods imported from abroad by visitors and Parks and as indirect taxes. These two components thus represent an outflow from the economy. In fact the Statistics Canada model considers amounts spent on imported goods and government revenue as not being reintroduced into the economy and therefore having no economic impact.

Subtracting therefore these two components from the final demand estimate leads to the more restricted concept of final Canadian demand. As one might expect, final Canadian demand refers to the amount remaining within our country's borders and which leads to the production of Canadian goods and services. In 1984-85, final Canadian demand totalled \$2.05 million. It is this amount which is used to evaluate the economic impact of the Chambly Canal. Final Canadian demand can be separated into the demand impacting Quebec industries and the demand impacting the industries of other provinces. With \$1.89 million in final demand, the province of Quebec takes more than 92% of the final Canadian demand.

Figure 1(c) summarizes the process thus far, while Figure 1(d) illustrates the inferences that may be drawn from final Canadian demand. Each of the elements in Figure 1(d) will be analyzed separately.

FIGURE 1(b)

Visitor Spending Having An Economic Impact

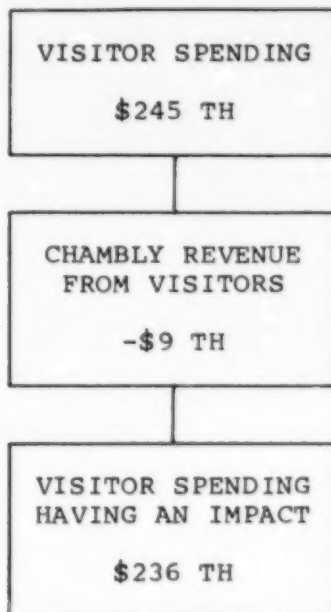

Table 1 depicts the final Canadian demand generated in the economy by industry sector. The primary industry categories include the extraction of natural resources (agriculture, mining, etc.); the secondary sector involves the processing industries (textiles, furniture, machinery, etc.); the construction sector includes all types of construction (buildings, roads, dams, etc.); the tertiary sector consists of service industries (transportation, communications, service to businesses, etc.).

Table 1 shows the predominance of the household sector in final Canadian demand analysis. In fact, salaries and wages paid by Parks amounted to \$915 thousand, or 45% of all domestic demand. The tertiary sector was second most important representing 34% of all final demand with parks' expenditures being mainly responsible for this high demand. The tertiary sector captured 99% of all visitor spending

FIGURE 1(c)

Final Canadian Demand Attributable
To Chambly Canal

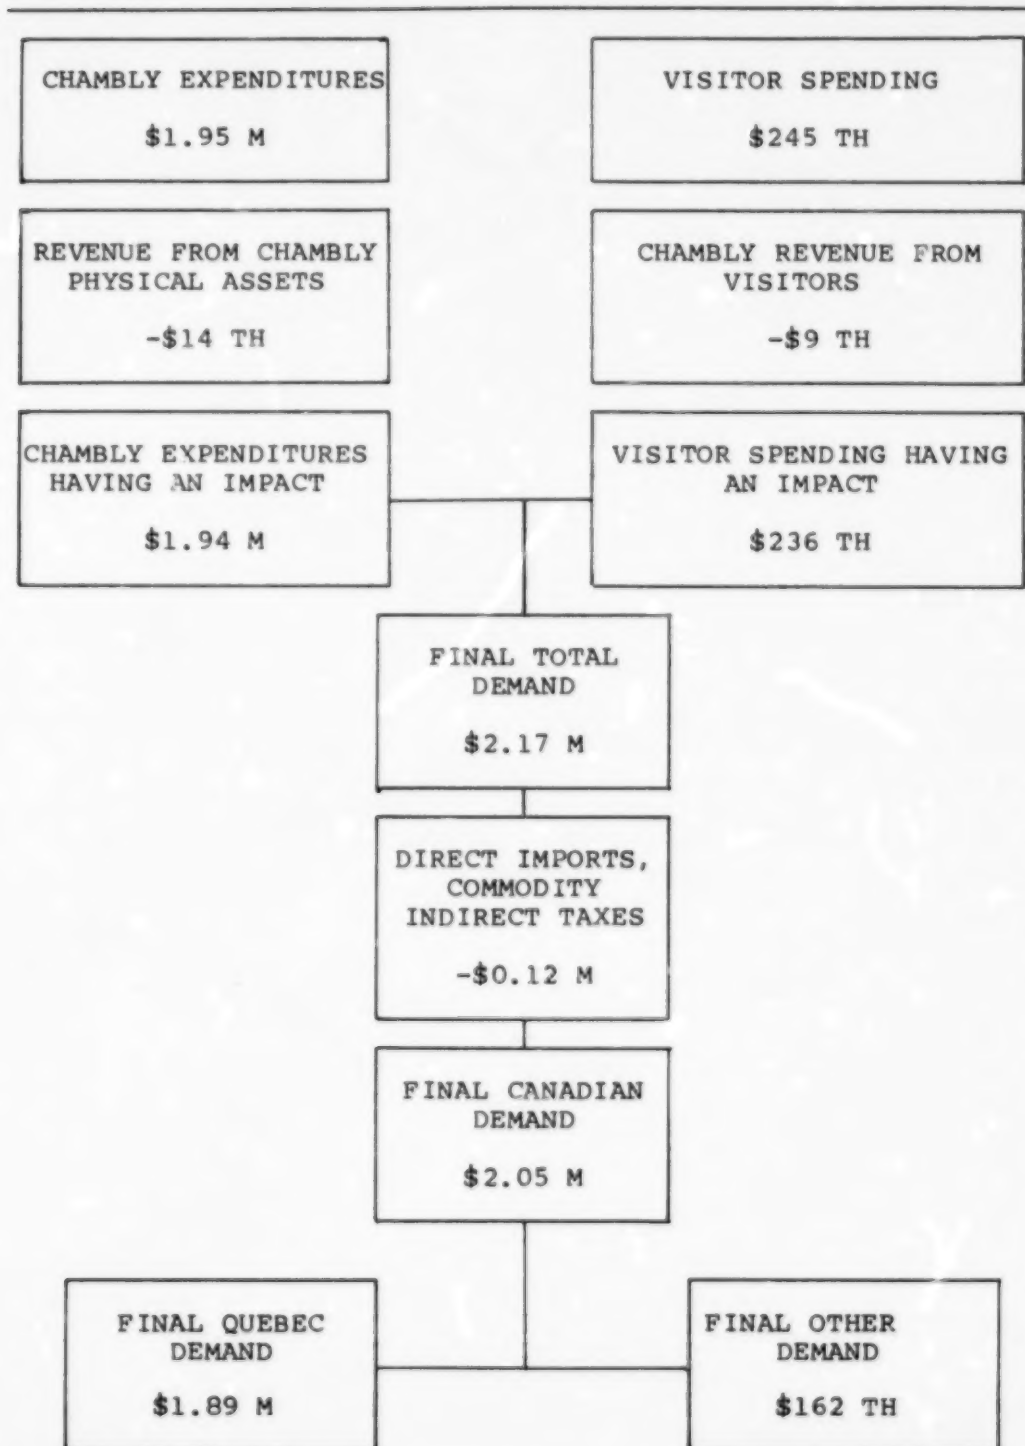

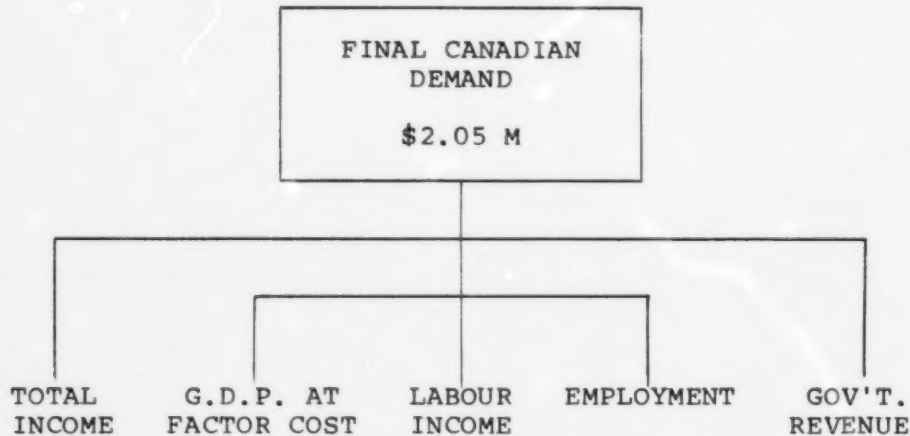

FIGURE 1(d)

Components Involved In Economic Impact Of
Chambly Canal

which is not surprising since most businesses involved in the tourism industry are in the tertiary sector. By contrast, Chambly Canal spent \$468 thousand in this sector, or 52% of its industrial demand. Somewhat less significant for the Chambly Canal is the \$333 thousand of final demand in the construction sector. This demand represents 37% of the industrial demand of Parks' expenditures. Chambly Canal was responsible for almost all the final domestic demand impacting the construction sector in Table 1.

Table 2 shows the final demand generated in Quebec. Comparison with Table 1 indicates that all construction demand and salaries and wages paid by the canal were in Quebec. Moreover, final demand distribution in Quebec is very similar to the final Canadian demand. This indicates that leakage is very low and that most of every dollar spent in Quebec (be it visitors or Parks) for the canal, remains in Quebec.

CHAPTER II

IMPACT ON INCOME IN QUEBEC

Final domestic demand generates many different types of income. The types of income analyzed in this chapter are labour income, gross domestic product and total income.

2.1 Labour Income

As the name indicates, labour income consists of the total pay earned by wage-earners (i.e. salaries, wages and other supplementary labour income). Table 3 shows the direct, indirect, and induced labour income generated by the final domestic demand of visitors and Chambly Canal. The total labour income generated amounts to \$1.92 million.

Visitor spending generates some \$149 thousand in income while canal expenditures generate \$1.77 million. Direct labour income was \$1.26 million compared to \$657 thousand for indirect and induced labour income. This shows that for every dollar of direct income generated by the canal and visitors, 52 cents of indirect and induced labor income are created. Direct labour income consists of the increased labour income resulting from initial spending. Indirect labour income is the labour income generated by the industries supplying the industries stimulated by the initial demand. Induced labour income results from the additional spending households make because of their increased direct and indirect labour income.

2.2 Gross Domestic Product

If the net income of individual businesses and other surpluses³ are added to labour income, the resulting figure is the gross domestic product at factor cost.

Gross domestic product (GDP) is the value of the net output of intermediary inputs (i.e. the value added to the total goods and services produced). Value added may be measured in terms of market price or factor cost. The GDP at market price indicates the total value added to goods and services. It is equal to the income generated by production and thus

3 Corporation profits, dividends paid to persons, capital cost allowance and depletion (mines and other extraction industries).

TABLE 3

Direct, Indirect And Induced Labour
Income Generated In Quebec

	<u>Chambly</u> <u>\$ 000</u>	<u>Visitors</u> <u>\$ 000</u>	<u>Total</u> <u>\$ 000</u>
Direct Labour Income	1,187.1	76.1	1,263.2
Indirect and Induced Labour Income	583.7	73.1	656.8
Total Labour Income	1,770.8	149.2	1,920.0

includes indirect taxes and subsidies. GDP at factor cost is the value added in relation to the factors of production: labour, material used, and capital. This index therefore excludes all indirect taxes. By eliminating the components that add nothing to the value of production and that go directly to government, the GDP at factor cost gives a more accurate picture of value added in the economy.

Table 4 shows the gross domestic product at factor cost generated in the Quebec economy for each industry sector. Thus the \$2.05 million in final Canadian demand (Table 1) produced by the Chambly Canal and visitor expenditures generated over \$2.62 million in value added to the Quebec economy. In other words, for every dollar in final demand that is attributable to the Chambly, \$1.28 of gross domestic product is generated in the Quebec economy. Assuming that visitor spending is attributable to the canal, every dollar spent (i.e. having an impact) by Parks for the Chambly Canal increases the value added in the Quebec economy by \$1.35.

A close study of Table 4 shows that the tertiary sector, with a GDP of \$1.15 million, is the main beneficiary. It should be recalled that most visitor services are in the tertiary sector: restaurants, accommodation, recreational activities, etc. Parks' purchases of professional, financial, transportation and communication services are also very important. The tertiary sector is closely followed by households, with \$994 thousand, and the construction sector, with \$172 thousand.

TABLE 4

Gross Domestic Product At Factor Cost Generated
In Quebec, By Industry Sector

<u>Industry Sector</u>	<u>Chambly</u> <u>\$ 000</u>	<u>Visitors</u> <u>\$ 000</u>	<u>Total</u> <u>\$ 000</u>
Primary	53.2	10.4	63.6
Secondary	223.2	26.6	249.8
Construction	169.8	2.2	172.0
Tertiary	939.5	205.7	1,145.2
- Transportation & warehousing	81.5	12.1	93.6
- Utilities	63.9	8.3	72.2
- Retail & trade	176.9	33.3	210.2
- Accommodation & restaurants	65.2	92.7	157.9
- Services to business	175.5	4.1	179.6
- Other	376.5	55.2	431.7
Sub-total	1,385.7	244.9	1,630.6
Households	987.2	6.7	993.9
- Salaries and wages paid by Chambly Canal	914.8	-	914.8
- Other households G.D.P.	72.4	6.7	79.1
Total	2,372.9	251.6	2,624.5

In Table 5, GDP at factor cost is broken down into direct, indirect and induced GDP. This shows that Chambly Canal expenditures had direct repercussions in the order of \$1.35 million compared to \$122 thousand for visitor spending. Direct GDP consists of the increased income resulting from initial spending. Direct GDP for all spending totals \$1.47 million.

Indirect GDP is the portion of value added produced in supplying the industries stimulated by initial demand. In effect, when demand increases in a given industry sector, this sector needs to obtain materials and supplies from other industries. In other words, indirect GDP is the value added in the economy in relation to these supply industries. Induced GDP results from an increase in economic activity due to additional spending by households because of their added income. Table 5 shows that indirect and induced GDP total approximately \$1.16 million: \$1.03 million of this comes from Chambly Canal expenditures and \$130 thousand from visitor spending.

2.3 Total Income

As explained earlier, GDP at factor cost consists of salaries and wages plus the net earnings of businesses and other surpluses. By adding indirect taxes to the GDP at factor cost figure while subtracting subsidies, we obtain the total income generated. Indirect taxes, which are not considered among income directly associated with the production of goods and services, nevertheless remain one of the types of income generated. Subsidies however are subtracted from the total since they represent public funds and cause a decrease in net government revenues.

Table 6 illustrates the breakdown of total income generated by spending attributable to the Chambly Canal. Parks' expenditures account for more than 90% of the \$2.87 million total income generated. Salaries, wages and supplementary labour income that is generated by these expenditures are the main type of income created. They represent over 66% of all income generated by the canal in Quebec. Figure 2(a) illustrates the process used to derive total income from labour income.

TABLE 5

Direct, Indirect And Induced Gross Domestic Product
At Factor Cost Generated In Quebec

In Quebec

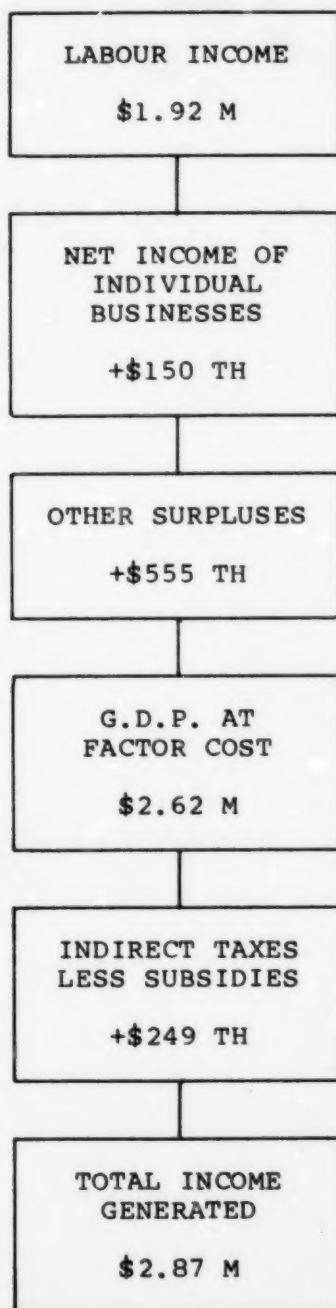

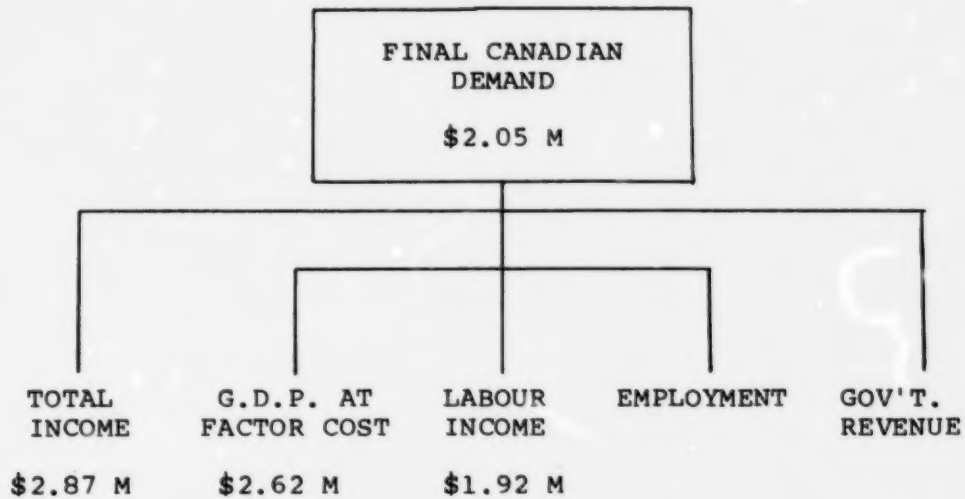

Figure 2(b) summarizes the topics covered thus far.

FIGURE 2(b)

Impact On Income In Quebec

CHAPTER III

IMPACT ON EMPLOYMENT IN QUEBEC

Spending by Parks and canal visitors also generates employment opportunities.

Table 7 shows the impact on employment that results from the final Canadian demand of \$2.05 million (Table 1). It shows that the canal and visitors generated some 93.6 person-years of work, including the 47 employees (full-time equivalent) of the canal. Visitors were responsible for the creation of 8.7 and Chambly Canal 84.9 person-years of employment respectively.

Once again, most of the jobs generated (74% excluding Parks employees) were in the tertiary sector (i.e. 34.5 person-years). This finding is not surprising since we already know that income generated in the tertiary sector was important (see Table 4), that the tertiary sector is highly labour-intensive and that visitors concentrate most of their spending on services in this sector.

Spending related to the existence of the Chambly Canal therefore has meaningful repercussions on job creation. Table 8 shows the number of direct, indirect and induced jobs, as well as the total jobs created in person-years. Of the 94 jobs created, more than 65% are direct when Parks' employees are included.

3.1 Labour Income and Employment Impact

In addition to creating more jobs, Chambly Canal expenditures also give rise to higher paying jobs. Using the figures for labour income generated and number of jobs created, the annual average salary paid for a job created by visitor spending was an estimated \$17,100. The corresponding figure for jobs created by the canal's expenditures was \$20,900. The combination of visitor and Chambly Canal spending creates a total of 94 jobs at an annual average salary of \$20,500. Since it is assumed that visitor spending results from the existence of the Chambly Canal, it could be said that the Chambly Canal creates one person-year of employment for every \$20,800 worth of Parks' expenditures.

TABLE 7

Person-Years Generated In Quebec
By Industry Sector

FIGURE 3(a)

Impact On Income And Employment In Quebec

CHAPTER IV

IMPACT ON GOVERNMENT REVENUE

Expenditures made by Parks and canal visitors also generates revenue for governments. Table 9 shows the government revenue generated by these expenditures. It shows clearly that the repartition of the impact by type of revenue is relatively similar no matter where the spending originates (visitors or Chambly Canal). Of the \$1.95 million in Parks' canal expenditures and the \$245 thousand in visitor spending, a total of \$935 thousand returns to various levels of government in Quebec. All direct and indirect taxes represent more than 97% of government revenue or \$912 thousand. Out of each dollar spent by Parks on the Chambly Canal, governments recover 48 cents in Quebec. Another \$291 thousand in government revenue is collected in the other provinces. As a whole, government revenue totals \$1.23 million in Canada.

Based on the National Income Accounts and the Economic Accounts⁴, it can be estimated that the federal government's share of the tax revenue (\$1.20 million) is \$355 thousand over and above the \$23 thousand collected directly. Subtracting these sources of revenue, the Chambly Canal costs the federal treasury \$1.95 million minus (\$355 thousand + \$23 thousand) = \$1.57 million in 1984-85.

Based on the Quebec Provincial Economic Accounts we can assume that of the tax revenue generated in Quebec (\$912 thousand in Table 9) the Quebec provincial government's share is \$385 thousand.

Impact On Income, Employment And Government
Revenue In Quebec

CONCLUSION

Although the primary objective of operating the Chambly Canal is the preservation of this historic national canal for the benefit and enjoyment of present and future generations, this report demonstrates that spending attributable to the canal facilities has an significant impact on the Quebec economy. In fact, whether for gross domestic product, labour income, job creation, or government revenues, the economic repercussions of the canal are significant.

Because the figures given in this report are simulation results, some factors that are difficult to take into account are omitted. These include volunteer work, unpaid work, market imperfections and capacity limitations. One must not lose sight of the fact that the figures should be viewed as approximate rather than absolute.

It should be recognized that the economic impact assessment does not include expenditures made by the private sector to construct facilities used to service visitors. Similarly, expenditures made by the visitors on recreation equipment used during their visit to the canal are not accounted for. Expenditures of other government departments not included in the canal's budget such as for the Department of Public Works are likewise not included in the assessment. Finally the report does not examine "primary" economic benefits such as the value visitors place on the opportunity to use the canal as a recreation resource.

A number of socio-economic questions are also avoided in this study. Structural changes arising in a given region around the canal are not considered. Are the jobs created seasonal or permanent? Do they improve the quality of life? Is there a spill-over effect on local entrepreneurship? Questions such as these are all socio-economic considerations that have been omitted from this study. The results included in this report have been analyzed strictly from an economic standpoint, which calls for a factual description of the impact of spending attributable to the Chambly Canal.
